

Sica Goes Green!

Our world needs a hand to be preserved for the well being of future generations. More and more people and businesses reason in terms of sustainability and a green economy.

Sica, an Italian pipe machinery producer, wants to contribute to saving energy, raw materials and keeping the environment clean and safe. This is why all its latest research and development efforts are aimed at going green and bringing pipe producers savings for a better world. Already in October, Sica's "Green Machinery" will be on display at the K exhibition in Dusseldorf.

Practical examples are: 1) Swarfless cut and chamfer technology for PVC pipe that saves raw materials, eliminates recycling, reduces maintenance costs, and assures a clean and noiseless environment. 2) Belling machines with short-wave ovens that are active only during the heating phase and for the time needed to reach the final set temperature of the material, for reducing energy consumption and avoiding scrap material.

These are only two important achievements, but there is more to come. Sica wants to bring its 51 years of history and know-how to the service of pipes producers, adding new technologies which will help them save money and which, at the same time, will protect the environment.
